

## ScanPlant NG Process Management

# Optimising productivity and resources

The ScanPlant Process Module provides a unique overview of the entire production, presenting the efficiency on the production lines, yields, give-away and other key figures, making it possible to monitor and control the plant more effectively.

# Overall Process Transparency

The ScanPlant NG Process Module handles all the steps in the production from the reception, consumption and production of goods to the dispatch of finished goods.

The module may be customised to individual requirements and provides a unique overview of the entire production, including the efficiency on the production lines, yields, give-away and other key figures, e.g. KPI's, which makes it possible to control the processes more effectively.

The key figures of the production as well as the KPI's can be monitored in real time as well as historically.

ScanPlant NG Process supports all units of products and materials, including raw materials, semi-finished products, spices, packaging materials and other consumables. All registration is done electronically with data control of the registrations, which eliminates paperwork in the production.

ScanPlant NG Process ensures registrations, which will save time for the employees and provide a more effective utilization of the resources in production.

By integrating the module Full Traceability, it is possible to automatically print relevant traceability information as well as to warn the operator not to use the products with certain traceability data.

By combining the process data with available data from the production or ERP systems, it is possible to generate key figures and KPI reports, which through SMS Office give a quick overview of the productivity of the company.
