

ScanX.NET ScanMobile

Full mobility and fast workflow

100% MOBILITY

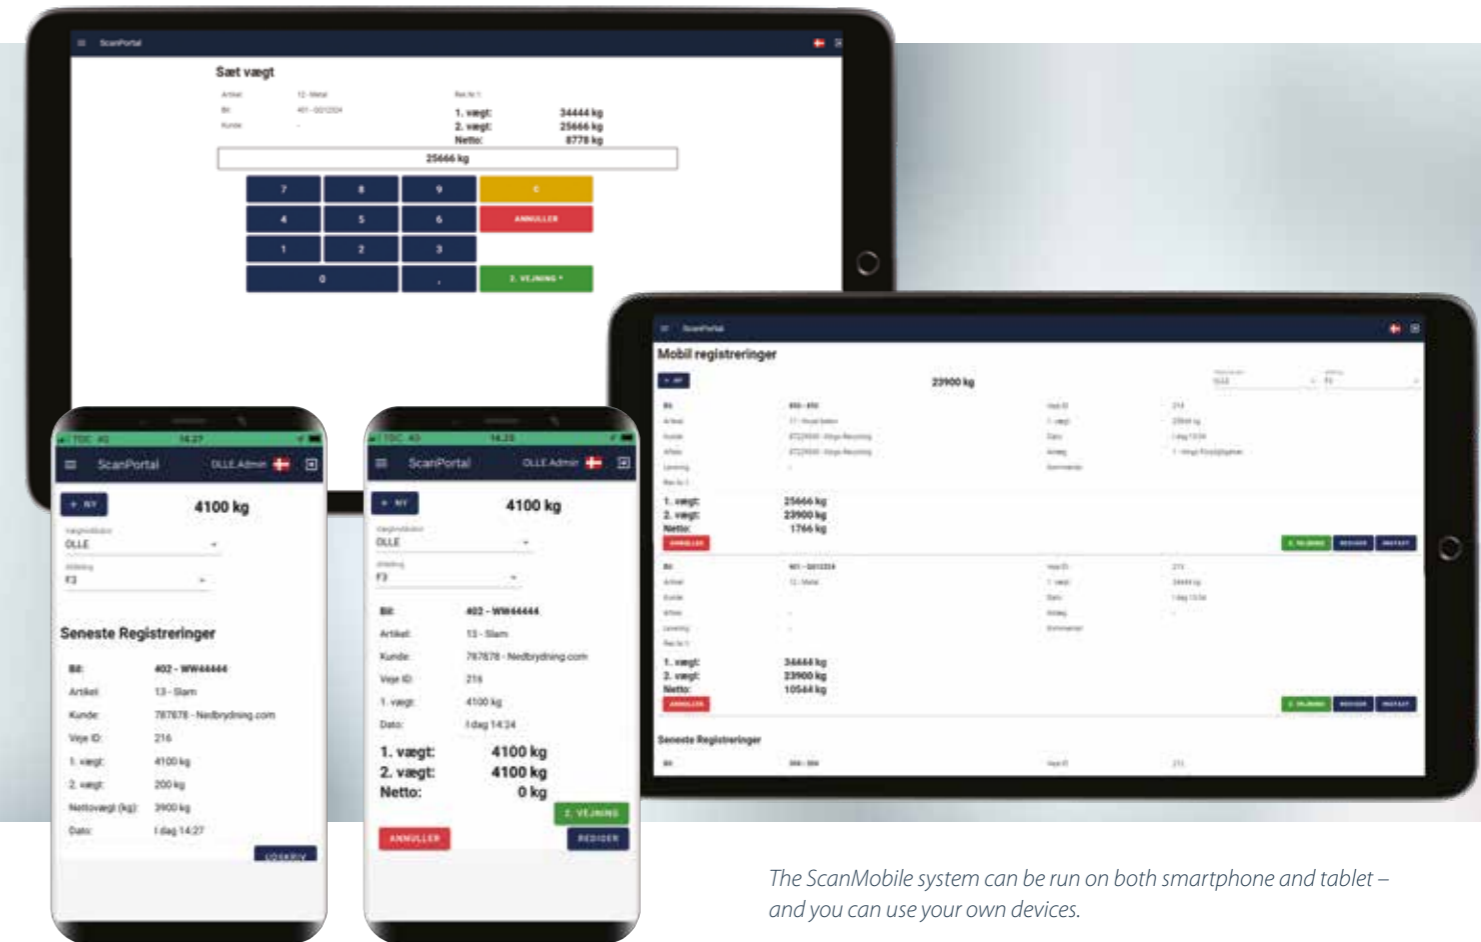

TOTAL OVERVIEW

EASY OPERATION

ScanMobile is a new cloud-based software solution under ScanPortal. It is used for setting up and editing weighing results for customers and carriers – on their own smartphone and tablet. The solution can be used by both on-site operators and lorry drivers.

scanvaegt
systems

The ScanMobile system can be run on both smartphone and tablet – and you can use your own devices.

Quick, easy and simple data entry

ScanMobile is a new cloud-based module that simplifies data entry when weighing all types of materials. Data entry is done quickly and easily on a smartphone and tablet, saving you a lot of time and giving you considerable freedom and flexibility.

ScanMobile is an effective tool for the on-site operator for setting up, entering and editing data on a smartphone and tablet. The software module runs on Scanvaegt's cloud system – ScanPortal – giving you direct access to data in the ScanX.NET system, wherever you are.

The module supports both single weighing and double weighing. ScanPortal is used to connect ScanMobile to a weighbridge, allowing you to transfer weighing results directly from the weighbridge onto the system.

ScanMobile also checks whether the weighbridge is steady – thereby ensuring that imprecise weighing results are avoided.

Full mobility for staff

Since ScanMobile runs on a smartphone and tablet, the system can be used anywhere. All data is stored the ScanX.NET system. This makes ScanMobile a 100% mobile solution, allowing workers complete freedom and flexibility.

Total management and effective workflow

ScanMobile is a complete system with simple functions, allowing operators to carry out all tasks, including:

- Setting up a new entry
- Editing an unfinished entry – e.g., changing item number
- Transferring weighing results from a connected weighbridge
- Manual entering of weighing results
- Setting up temporary tare/empty weight – automatically reset once a day
- Completing the data entry
- Printing the weighing slip on a connected printer

Direct access to Delivery Inspection

ScanMobile has a shortcut key for the Delivery Inspection module, which is used for mandatory acceptance testing with inspection of loads. This means that the ScanMobile operator can see completed data entries in Delivery Inspection and enter any deviations and reclassifications – quickly and efficiently.

Benefits for the on-site operator

The on-site operator can use ScanMobile to enter weighing results on his smartphone and tablet, set up new users, lock tare weight, edit data and see the whole site.

Easy to operate

ScanMobile has a simple, easy-to-understand user interface with logical design, dropdowns with pre-selections and efficient workflow. This makes it easy for the operator to set up new users and enter department, vehicle and item, as well as agreement, delivery, customer, order number, plant, transporter and comment.

The weighing result is easily linked to an entry by either entering the data manually or transferring it from a connected weighbridge.

The screen on ScanMobile can be customised so that only the relevant data fields are displayed for the operator – simplifying overview and ensuring easy operation.

Benefits

- Security for correct data entry
- 100% mobility – tasks can be solved anywhere and at any time
- Streamlining of workflow and data entry
- Total overview of all vehicles on site and central support

Benefits for the driver

The module also gives the driver new time-saving benefits. The driver can, for example, log into ScanMobile on his own smartphone, so that he does not have to enter data at an external weighing terminal. This saves valuable time.

ScanMobile can be used to “lock” the vehicle's tare/empty weight for a day. This means that the driver only has to weigh the vehicle's empty weight once and can then drive the rest of the day without having to weigh the empty vehicle every time. This also saves a lot of time and speeds up the workflow.

When logging on, the driver can see all the weighing he has carried out, ensuring a complete overview at all times. The overview also constitutes a digital receipt for the weighing.

The driver can also “reuse” data in the history by simply entering a tick. The driver does not then have to enter data whenever he drives with the same load.

System requirements

- Smartphone or tablet running on a modern browser such as iOS or Android running on Safari or Chrome
- ScanX.NET 2.4
- Extension.ScanPortal 2.4
- ScanPortal set-up
- ScanPortal User Agreement

Market-leading supplier

Scanvaegt Systems is one of the industry's most experienced suppliers of solutions for weighing, data entry, reporting and inspection. Customers include both private and public companies within the environment and energy sector, the recycling industry, the construction industry, as well as incineration and sorting plants, etc.

We develop, produce and sell scalable weighing solutions that can be adapted to any industry and any purpose. In addition to software and weighbridges, the solution can include terminals, boom systems, traffic management and monitoring equipment, as well as number plate recognition and inspection systems. It offers a unique opportunity to scale up from single stand-alone systems to more complex contract solutions.

Scanvaegt Systems A/S is a Danish-owned company, established in 1932, and employs approximately 200 people. The company is headquartered in Aarhus, has a sales and service network in Denmark, subsidiaries in Norway, Sweden and Germany, and dealers in a number of other countries.

ScanCare Service Partner

Service and support are important factors in any manufacturing business. They are watchwords for us. We therefore offer all our customers comprehensive service and support in the form of preventive maintenance agreements, training and instruction, installation, spare parts, a hotline support, software service and verification.
